

WGS Cluster Assessment Tool

Considerations for assessing Salmonella, E. coli and Shigella clusters for further follow-up

Note: These are intended to be guidelines; if additional information on clusters is available and suggests that further follow-up on clusters not meeting these criteria is warranted, CFEZID may initiate follow up.

¹ Clusters are considered multi-jurisdictional when they contain **human** isolates from 2 or more P/Ts

² Guidelines for WGS interpretation are determined by the Public Health Agency of Canada's National Microbiology Laboratory
